| Name                  | A unique name within the network security group. The name can be up to 80 characters long. It must begin with a word character, and it must end with a word character or with <code>_</code> . The name can contain other characters, <code>_, @, /, or \</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Priority              | <p>A number between 100 and 4096. Rules are processed in priority order, with lower numbers processed before higher numbers because lower numbers have higher priority. Once traffic matches a rule, processing stops. As a result, any rules that exist with lower priorities (higher numbers) that have the same attributes as rules with higher priorities aren't processed.</p> <p><b>Azure default security rules are given the lowest priority (highest number) to ensure your custom rules are always processed first.</b></p>                                                                                                                                                                                                                                                                                                                                                                             |
| Source or destination | <p>You can specify any IP, individual IP address, a CIDR block (for example, 10.0.0.0/24), a <a href="#">service tag</a>, or an <a href="#">application security group</a>. To specify a particular Azure resource, use the IP address or IP address assigned to the resource. For inbound traffic, network security groups process traffic after Azure translates public IP addresses to private IP addresses. For outbound traffic, network security groups process traffic before translating private IP addresses to public IP addresses.</p> <p>Enter a range, service tag, or application security group to reduce the number of security rules needed. Augmented security rules allow specifying multiple individual IP addresses and ranges in a single rule. However, you can't specify multiple service tags or application groups in a single rule. Augmented security rules are only available in</p> |
